<Our dental specialists and technicians worked and treated together for our patients>

Time has passed after our patient lost all of her lower molars. As a result, her upper left molar protruded, her lower premolars inclined and her lower front teeth became crowded. In this situation, implant treatment alone or orthodontic treatment alone was difficult.

We needed to install 4 dental implants in her lower molar place before starting orthodontic treatment.

We made setup models in order to know the desirable goal of comprehensive treatment and the right place to install dental implants. This information was shared between our implant specialists and orthodontists.
